

This document describes the output report structure expected from this year's joint working.

Report structure:

1. Introduction

We have defined the requirements, now we are building on this to consider the solution options available, assess how those options may meet the requirements and the pros and cons of those options. Include a section on value of demand response, but stress that this is to support requirements and the requirements have been baselined.

2. Smart Demand Response Drivers, Benefits & Requirements

Benefits and Requirements document is a document that shall be published in its own right, but the content will also be incorporated here.

3. Definition of Options

Define what the options are and importantly reference to source material for the models (particularly the market operator model – Eurelectric etc.)

4. Assessment of how options deliver requirements

Table with Options 1-4 along the top; requirements along the side and how they are met

5. Further Pros/Cons of Options

Definition of other considerations (include the ones above (commercial, regulatory, wider context etc.)

Assessment of these. Again, options along the top and further assessment criteria down the side, including:

Scale of regulatory change

Potential Cost

Time to deliver

Operational Complexity

Risk to security of supply

Conformance with other international models and reasons for variance

And probably plenty of others...

6. Analysis and Conclusions

Analyse the results above, weight up the pros and cons, see if we can find some industry consensus, try to present the preferred models of different stakeholders, see if there is consensus

7. Recommendations and Next Steps

Any firm conclusions, what needs to be done next to make something happen
